

The competent solution for rehabilitating glass surfaces on site without removal!

Contemporary architecture is marked by increasingly large glass surfaces in ever-increasing numbers, and this will continue in the future. But glass is a very demanding construction material, since surface damage such as scratches, etching or cement blemishes are all but inevitable on the long way from production to final installation.

In addition, improper cleaning, wear and tear, aging or the ever-increasing problem of vandalism (glass scratching, graffiti, etc.) may cause considerable damage to glass surfaces.

In the past, there was no alternative to replacing such damaged glass surfaces. Today, another option exists: the VETROX® system:

This patented worldwide innovation has been designed for treating and repairing homogeneous glass surfaces of all sizes without requiring removal of the glass – directly on site!

The advantages:

- Reduced costs
- Faster responses
- On-site repairs
- No interruption of production for customers
- Simple supply chain
- No cost of removal and re-installation
- Environmentally friendly process

Our end customers:

- Architects and construction managers
- General contractors
- Insurance companies
- Window and glass manufacturers
- Facility managers (banks, authorities, etc.)
- Property owners
